Block properties

What are block properties?

Block properties are the different values that blocks have within the Minecraft code that determine how a block behaves in the game. Each block has defined properties with some being more unique than others.

Solid

Solid blocks are generally opaque (non-transparent) blocks that are a full block. However, there are a few blocks that don't follow this definition. The true method of determining if a block is solid is by seeing if a comparator can read a container through that block.
